SHORTENED STATUTORY PERIOD OF RESPONSE	MAIL DATE	DELIVERY MODE
3 MONTHS	02/09/2007	PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

If NO period for reply is specified above, the maximum statutory period will apply and will expire 6 MONTHS from the mailing date of this communication.

Office Action Summary	Application No.	Applicant(s)	
	10/826,016	IMASEKI ET AL.	
	Examiner	Art Unit	
	Ben Lewis	1745	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☐ Responsive to communication(s) filed on ____.
- 2a) ☐ This action is FINAL. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-19 is/are pending in the application.
- 4a) Of the above claim(s) ____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) ____ is/are allowed.
- 6) ☒ Claim(s) 1-19 is/are rejected.
- 7) ☐ Claim(s) ____ is/are objected to.
- 8) ☐ Claim(s) ____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 15 April 2004 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. ____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Claim Rejections - 35 USC § 112

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claims 1-2 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

3. Claims 1-2 recite the limitation "the gas". There is insufficient antecedent basis for this limitation in the claim. It is not clear to the examiner whether "the gas" refers to supply air or a fuel gas.

4. With respect to claim 6, the recitation "pie" should read "pipe."

5. Claims 4-7 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. The claims are drawn to a product and have methods of operating or using the product. In this case operating the fuel cell apparatus step(s) mixed in with the apparatus claim. It is held that a single claim, which claims both an apparatus and the method steps of using the apparatus, is indefinite (MPEP 2173.05).

Art Unit: 1745

Furthermore, mixing statutory classes together would result in the public not knowing the meets and bounds of the claim and whether or not the claims are being infringed upon.

Claims 16-19 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. The claims are drawn to a product and have methods of operating or using the product.

With respect to claim 16, steps of wherein a flow amount of ventilation current is controlled depending upon fuel gas concentration mixed in with the product claim.

With respect to claim 17, steps of wherein a ventilation amount within said cooling liquid storage is increased when the fuel gas concentration within said cooling liquid storage container arrives at a prescribed concentration or more.

With respect to claim 18, steps of wherein the gas within said cooling liquid storage container is exhausted by said gas exhaust mechanism, when the pressure within said air pipe is increased. Whereby said fuel gas concentration within said cooling liquid storage container is decreased to a prescribed concentration.

With respect to claim 17, steps of wherein the pressure within said cooling liquid storage container is decreased to increase the flow amount of said ventilation current when the fuel gas concentration within said cooling liquid storage container arrives at a prescribed concentration.

Art Unit: 1745

It is held that a single claim, which claims both an apparatus and the method steps of using the apparatus, is indefinite (MPEP 2173.05).

Furthermore, mixing statutory classes together would result in the public not knowing the meets and bounds of the claim and whether or not the claims are being infringed upon.

Claim Rejections - 35 USC § 103

6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

7. Claims 1-2 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hirakata (U.S. Pub. No. 2001/0019789 A1) in view of Mizuno (U.S. Pub. No. 2002/0189873 A1).

With respect to claim 1, Hirakata et al. disclose a heat exchange system (title) wherein a radiator **10** is a heat exchange device for cooling the cooling water warmed

Art Unit: 1745

by the fuel cell **30**, and includes an upper tank **12** and a lower tank **14** for temporarily storing the cooling water, and a core **16** for passing the cooling water (Paragraph 0032).

With respect to the mixing of the separated gas with the air supplied or exhausted from the fuel cell, Hirakata teach that when the pressure inside the upper tank **12** is high, the cooling water is pushed out as described above from the upper tank **12** into the reserve tank **20** through the cooling water tube **65** so that the hydrogen gas caught within the upper tank **12** is also pushed out into the reserve tank **20** along with the cooling water. The hydrogen gas pushed out together with the cooling water turns into bubbles in the cooling water **22** and floats up to the surface of the water, to be present at the top of the reserve tank **20** (Paragraph 0058). Hirakata also teach that the reserve tank **20** is a simple sealed type reserve tank, and an air intake tube **66** connects to the reserve tank **20** to maintain atmospheric pressure inside the reserve tank **20** (Paragraph 0043).

With respect to exhausting the gas, Hirakata et al. teach that in the heat exchange system of the present embodiment, if hydrogen gas leaks into the cooling water, the hydrogen sensors **50** and **52** immediately detect the leakage, and the hydrogen gas leakage warning lamp **92** informs the driver of the leakage. The hydrogen gas collected in the upper tank **12** "hydrogen separator" of the radiator **10** and the hydrogen gas collected at the top of the reserve tank **20** "hydrogen separator" can be easily discharged "exhausted" into the air by opening the radiator cap **18** and the cooling water supply cap **24**, respectively (Paragraph 0060).

Hirakata et al. does not specifically teach using air supplied to or exhausted from the fuel cell. However, Mizuno disclose an on-vehicle structure of fuel cell system wherein the hydrogen gas discharged from the shut valve **412** is supplied to the hydrogen dilutor **424** after flowing through the discharging channel **405**. Oxygen off-gas is also supplied to the hydrogen dilutor **424** after flowing through the oxygen off-gas introducing channel **505** which branches from the oxygen off-gas discharging channel **503**. The hydrogen dilutor **424** dilutes the discharged hydrogen gas from the shut valve **412** by mixing the supplied hydrogen gas and the oxygen off-gas. The diluted hydrogen gas is introduced into the oxygen off-gas discharging channel **503** and is further mixed with the oxygen off-gas flowing in the oxygen off-gas discharging channel **503**. Then the mixed gas is exhausted into the external atmosphere from the off-gas discharging outlet **514**. Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to use the dilution of hydrogen gas with exhaust air system of Mizuno to dilute the hydrogen of Hirakata et al. because an air diluted exhaust gas with low hydrogen concentration is more safe.

8. Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hirakata (U.S. Pub. No. 2001/0019789 A1) in view of Mizuno (U.S. Pub. No. 2002/0189873 A1) and further in view of Jia et al. (U.S. Pub. No. 2003/0224226 A1).

With respect to claim 2, Hirakata et al as modified by Mizuno disclose a heat exchange system (title) in paragraph 7 above. Hirakata et al. as modified by Mizuno do not specifically teach wherein the gas mixed with air supplied to the fuel cell is

Art Unit: 1745

introduced into the cathode of the fuel cell. However, Jia et al. disclose a conditioning methode for fuel cells (title) wherein, controller **18** signals oxidant shutoff valve **15** to close and signals fuel shutoff valve **16** and fuel conditioning valve **17** to open thereby providing hydrogen directly to cathode **4** (Paragraph 0021). Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the hydrogen feed to the cathode of Jia et al. into the fuel cell system of Hirakata et al. as modified by Mizuno because combustion of hydrogen internally as opposed to environmental exhaustion improves safety of the fuel cell system.

9. Claim 3-12 and 15-19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hirakata (U.S. Pub. No. 2001/0019789 A1) in view of Mizuno (U.S. Pub. No. 2002/0189873 A1).

With respect to claims 3, 9 and 15, Hirakata et al. disclose a heat exchange system (title) wherein a radiator **10** is a heat exchange device for cooling the cooling water warmed by the fuel cell **30**, and includes an upper tank **12** and a lower tank **14** for temporarily storing the cooling water, and a core **16** for passing the cooling water (Paragraph 0032). Hirakata et al. also teach that the cooling water cooled and stored in the lower tank **14** flows out from the lower tank **14** to reach the fuel cell **30** through the cooling water passage **60**. A water pump **70** is provided midway in the cooling water passage **60** so as to forcibly circulate the cooling water flowing through the cooling

Art Unit: 1745

water passage 60. The water pump 70 and another water pump 76 which will be described later are both electrically driven (Paragraph 0034).

With respect to the liquid storage container communicating with the circulation passage via a gas drawing passage and wherein the air incorporated into the signal pressure pipe from the supply air pipe side is pushed back towards said air supply pipe, Hirakata et al. teach that when the pressure inside the upper tank 12 is high, the cooling water is pushed out as described above from the upper tank 12 into the reserve tank 20 through the cooling water tube 65 "gas drawing passage" so that the hydrogen gas caught within the upper tank 12 is also pushed out into the reserve tank 20 along with the cooling water. The hydrogen gas pushed out together with the cooling water turns into bubbles in the cooling water 22 and floats up to the surface of the water, to be present at the top of the reserve tank 20 (Paragraph 0058). Hirakata also teach that the reserve tank 20 is a simple sealed type reserve tank, and an air intake tube 66 connects to the reserve tank 20 to maintain atmospheric pressure inside the reserve tank 20 (Paragraph 0043).

With respect to exhausting the gas, Hirakata et al. teach that in the heat exchange system of the present embodiment, if hydrogen gas leaks into the cooling water, the hydrogen sensors 50 and 52 immediately detect the leakage, and the hydrogen gas leakage warning lamp 92 informs the driver of the leakage. The hydrogen gas collected in the upper tank 12 "hydrogen separator" of the radiator 10 and the hydrogen gas collected at the top of the reserve tank 20 "hydrogen separator" can

Art Unit: 1745

be easily discharged "exhausted" into the air by opening the radiator cap **18** and the cooling water supply cap **24**, respectively (Paragraph 0060).

Hirakata et al. does not specifically teach using air supplied to or exhausted from the fuel cell. However, Mizuno disclose an on-vehicle structure of fuel cell system wherein the hydrogen gas discharged from the shut valve **412** is supplied to the hydrogen dilutor **424** after flowing through the discharging channel **405**. Oxygen off-gas is also supplied to the hydrogen dilutor **424** after flowing through the oxygen off-gas introducing channel **505** which branches from the oxygen off-gas discharging channel **503**. The hydrogen dilutor **424** dilutes the discharged hydrogen gas from the shut valve **412** by mixing the supplied hydrogen gas and the oxygen off-gas. The diluted hydrogen gas is introduced into the oxygen off-gas discharging channel **503** and is further mixed with the oxygen off-gas flowing in the oxygen off-gas discharging channel **503**. Then the mixed gas is exhausted into the external atmosphere from the off-gas discharging outlet **514**. Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to use the dilution of hydrogen gas with exhaust air system of Mizuno to dilute the hydrogen of Hirakata et al. because an air diluted exhaust gas with low hydrogen concentration is more safe.

With respect to claims 4 and 6, With respect to exhausting the gas, Hirakata et al. teach that in the heat exchange system of the present embodiment, if hydrogen gas leaks into the cooling water, the hydrogen sensors **50** and **52** immediately detect the leakage, and the hydrogen gas leakage warning lamp **92** informs the driver of the

Art Unit: 1745

leakage. The hydrogen gas collected in the upper tank **12** "hydrogen separator" of the radiator **10** and the hydrogen gas collected at the top of the reserve tank **20** "hydrogen separator" can be easily discharged "exhausted" into the air by opening the radiator cap **18** and the cooling water supply cap **24**, respectively (Paragraph 0060).

Hirakata et al. also teach that when the pressure inside the upper tank **12** is high, the cooling water is pushed out as described above from the upper tank **12** into the reserve tank **20** through the cooling water tube **65** "gas drawing passage" so that the hydrogen gas caught within the upper tank **12** is also pushed out into the reserve tank **20** along with the cooling water. The hydrogen gas pushed out together with the cooling water turns into bubbles in the cooling water **22** and floats up to the surface of the water, to be present at the top of the reserve tank **20** (Paragraph 0058). Hirakata also teach that the reserve tank **20** is a simple sealed type reserve tank, and an air intake tube **66** connects to the reserve tank **20** to maintain atmospheric pressure inside the reserve tank **20** "exhaust pipe" (Paragraph 0043).

With respect to claim 10, Hirakata et al. teach that in the heat exchange system of the present embodiment, if hydrogen gas leaks into the cooling water, the hydrogen sensors **50** and **52** "means for detecting fuel gas" immediately detect the leakage, and the hydrogen gas leakage warning lamp **92** informs the driver of the leakage. The hydrogen gas collected in the upper tank **12** "hydrogen separator" of the radiator **10** and the hydrogen gas collected at the top of the reserve tank **20** "hydrogen separator" can

Art Unit: 1745

be easily discharged "exhausted" into the air by opening the radiator cap **18** and the cooling water supply cap **24**, respectively (Paragraph 0060).

With respect to claims 11, 12, 16-19, Hirakata et al. teach that when the pressure inside the upper tank **12** is high, the cooling water is pushed out as described above from the upper tank **12** into the reserve tank **20** through the cooling water tube **65** "gas drawing passage" so that the hydrogen gas caught within the upper tank **12** is also pushed out into the reserve tank **20** along with the cooling water. The hydrogen gas pushed out together with the cooling water turns into bubbles in the cooling water **22** and floats up to the surface of the water, to be present at the top of the reserve tank **20** (Paragraph 0058). Hirakata also teach that the reserve tank **20** is a simple sealed type reserve tank, and an air intake tube **66** connects to the reserve tank **20** to maintain atmospheric pressure "stationary pressure" inside the reserve tank **20** "exhaust pipe" (Paragraph 0043).

10. Claims 13 and 14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hirakata (U.S. Pub. No. 2001/0019789 A1) in view of Mizuno (U.S. Pub. No. 2002/0189873 A1) and further in view of Jia et al. (U.S. Pub. No. 2003/0224226 A1).

With respect to claim 13, Hirakata et al. disclose a heat exchange system (title) wherein a radiator **10** is a heat exchange device for cooling the cooling water warmed

Art Unit: 1745

by the fuel cell **30**, and includes an upper tank **12** and a lower tank **14** for temporarily storing the cooling water, and a core **16** for passing the cooling water (Paragraph 0032).

With respect to the mixing of the separated gas with the air supplied or exhausted from the fuel cell, Hirakata teach that when the pressure inside the upper tank **12** is high, the cooling water is pushed out as described above from the upper tank **12** into the reserve tank **20** through the cooling water tube **65** so that the hydrogen gas caught within the upper tank **12** is also pushed out into the reserve tank **20** along with the cooling water. The hydrogen gas pushed out together with the cooling water turns into bubbles in the cooling water **22** and floats up to the surface of the water, to be present at the top of the reserve tank **20** (Paragraph 0058). Hirakata also teach that the reserve tank **20** is a simple sealed type reserve tank, and an air intake tube **66** connects to the reserve tank **20** to maintain atmospheric pressure inside the reserve tank **20** (Paragraph 0043).

With respect to exhausting the gas, Hirakata et al. teach that in the heat exchange system of the present embodiment, if hydrogen gas leaks into the cooling water, the hydrogen sensors **50** and **52** immediately detect the leakage, and the hydrogen gas leakage warning lamp **92** informs the driver of the leakage. The hydrogen gas collected in the upper tank **12** "hydrogen separator" of the radiator **10** and the hydrogen gas collected at the top of the reserve tank **20** "hydrogen separator" can be easily discharged "exhausted" into the air by opening the radiator cap **18** and the cooling water supply cap **24**, respectively (Paragraph 0060).

Hirakata et al. does not specifically teach using air supplied to or exhausted from the fuel cell. However, Mizuno disclose an on-vehicle structure of fuel cell system wherein the hydrogen gas discharged from the shut valve **412** is supplied to the hydrogen dilutor **424** after flowing through the discharging channel **405**. Oxygen off-gas is also supplied to the hydrogen dilutor **424** after flowing through the oxygen off-gas introducing channel **505** which branches from the oxygen off-gas discharging channel **503**. The hydrogen dilutor **424** dilutes the discharged hydrogen gas from the shut valve **412** by mixing the supplied hydrogen gas and the oxygen off-gas. The diluted hydrogen gas is introduced into the oxygen off-gas discharging channel **503** and is further mixed with the oxygen off-gas flowing in the oxygen off-gas discharging channel **503**. Then the mixed gas is exhausted into the external atmosphere from the off-gas discharging outlet **514**. Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to use the dilution of hydrogen gas with exhaust air system of Mizuno to dilute the hydrogen of Hirakata et al. because an air diluted exhaust gas with low hydrogen concentration is more safe.

With respect to returning the mixed gas into said air supply air pipe via said outflow pipe, Hirakata et al as modified by Mizuno disclose a heat exchange system (title) in paragraph 2 above. Hirakata et al. as modified by Mizuno do not specifically teach wherein the gas mixed with air supplied to the fuel cell is introduced into the cathode of the fuel cell. However, Jia et al. disclose a conditioning method for fuel cells (title) wherein, controller **18** signals oxidant shutoff valve **15** to close and signals fuel shutoff valve **16** and fuel conditioning valve **17** to open thereby providing hydrogen

Art Unit: 1745

directly to cathode 4 (Paragraph 0021). Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the hydrogen feed to the cathode of Jia et al. into the fuel cell system of Hirakata et al. as modified by Mizuno because combustion of hydrogen internally as opposed to environmental exhaustion improves safety of the fuel cell system.

With respect to claim 14, Hirakata et al. teach that in the heat exchange system of the present embodiment, if hydrogen gas leaks into the cooling water, the hydrogen sensors 50 and 52 "means for detecting fuel gas" immediately detect the leakage, and the hydrogen gas leakage warning lamp 92 informs the driver of the leakage. The hydrogen gas collected in the upper tank 12 "hydrogen separator" of the radiator 10 and the hydrogen gas collected at the top of the reserve tank 20 "hydrogen separator" can be easily discharged "exhausted" into the air by opening the radiator cap 18 and the cooling water supply cap 24, respectively (Paragraph 0060).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Ben Lewis whose telephone number is 571-272-6481. The examiner can normally be reached on 8:30am - 5:30pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Patrick Ryan can be reached on 571-272-1292. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
